Listing of Claims:

This listing of claims reflects all claim amendments and replaces all prior versions, and listings, of claims in the application. Material to be inserted is in **bold and underline**, and material to be deleted is in **strikeout** or (if the deletion is of five or fewer consecutive characters or would be difficult to see) in double brackets [[]].

1. (previously presented) Assistive-listening system for use with sound-producing equipment that produces sound for hearing-impaired listeners and normal-hearing listeners, the sound-producing equipment including a signal source and first and second sound sources operatively associated with the signal source and configured to produce sound corresponding to signals received from the signal source, the assistive-listening system comprising:

a volume control operatively associated with the signal source and configured to proportionally change the volume of both the first and second sound sources; and

a support structure configured to support and position the second sound source so that the sound from the second sound source is directed vertically <u>from above the hearing-impaired listener</u>, thereby allowing a <u>the hearing-impaired listener may to</u> listen effectively to sound controlled by the volume control without disturbing normal-hearing listeners.

2. (original) The assistive-listening system of claim 1, wherein the support structure positions the second sound source such that it is closer to the hearing-impaired listener than the first sound source.

Page 2 - AMENDMENT; Serial No. 10/025,313; Our File – ULR.302A 3. (original) The assistive-listening system of claim 1, wherein the support structure positions the second sound source generally above the hearing-impaired listener's head, such that sound is directed generally downward onto the hearing-impaired listener.

4. (original) The assistive-listening system of claim 3, wherein the second sound source is positioned within six inches of the hearing-impaired listener's head without touching the hearing-impaired listener's head.

5. (original) The assistive-listening system of claim 1, further comprising a second volume control configured to change the volume of the second sound source without affecting the volume of the first sound source.

6. (previously presented) A method of assistive-listening for use with sound-

producing equipment for **hearing-impaired** listeners **and normal-hearing listeners**,

the sound-producing equipment including a signal source and first and second sound

sources operatively associated with the signal source and configured to produce sound

corresponding to signals received from the signal source, the method comprising:

providing the first sound source for normal-hearing listeners;

providing the second sound source for a hearing-impaired listener, where the

second sound source is positioned closer to the hearing-impaired listener than the first

sound source, and is positioned so that sound from the second sound source is directed

vertically **from above a hearing-impaired listener**;

providing a volume control operatively associated with the signal source and

configured to proportionally change the volume of both the first and second sound

sources; and

where the second sound source permits the hearing-impaired listener to listen

effectively to sound controlled by the volume control without disturbing normal-hearing

listeners.
